ABSTRACT: Two new species of *Diplommatina* from limestone hills on Borneo are described: *D. heteropleura* sp. nov., from Sarawak (Malaysia) and *D. stenoacron* sp. nov., from East Kalimantan (Indonesia). The first is uniquely identified among the Bornean *Diplommatina* by the arrangement of radial ribs: widely spaced on all whorls except the last 1.5, where they are closely spaced; the second belongs to a small group of species without radial ribs but is larger than any of them.

KEY WORDS: land snails; Malaysia; Indonesia; Borneo

INTRODUCTION

Bornean *Diplommatina* was revised by VERMEULEN (1993). Species were subsequently added by VERMEULEN (1996), VERMEULEN et al. (2015), and MARZUKI (2019). In the present paper, we describe two new species: *Diplommatina heteropleura* sp. nov. from Sarawak (Malaysia) and *D. stenoacron* sp. nov. from East Kalimantan (Indonesia). We assume that both

are Bornean endemics (as are most Bornean species of the genus). The first is likely to have a very limited distribution in submontane forest on limestone bedrock of the Mulu area, the range of the second is impossible to assess because of very limited collecting in East Kalimantan.

MATERIAL AND METHODS

The material studied derives from the private collection of the first author ('V' in the lists of examined material below). The holotypes are stored at the Zoological Museum (MZU) of the Universiti

Malaysia Sarawak (UNIMAS). The illustrations are by the first author, with the aid of a Leica Wild M8 stereo microscope with a Camera Lucida device.
